

RITHIC HITESH B

+91 6382324269 | rithichitesh@gmail.com | Chennai, Tamil Nadu

ABOUT

Artificial Intelligence and Data Science undergraduate with interests in Machine Learning, Computer Vision, Intelligent Automation, and Smart Systems. Experienced in developing software-driven solutions and interdisciplinary projects involving AI, simulation, and embedded technologies.

SKILLS

Software & Development:

- Python, Advanced JavaScript, Node.js
- C, C++
- HTML, CSS

AI & Data Science:

- Machine Learning
- Computer Vision
- Data Analysis

Automation & Systems:

- AI Workflow Automation
- System Level Debugging
- Performance Optimization
- Runtime Diagnostics

Tools & Strengths:

- Git, Power BI, Excel, PDF.js
- Interdisciplinary Project Design
- Core Problem Diagnostics

EDUCATION

Sri Venkateswara College of Engineering

2024 - 2028

Bachelor of Technology in Artificial Intelligence and Data Science

PROJECTS

COMPLETED TOP 3

1: Morphed Face Detection System

- Developed a machine learning solution for identifying morphed and manipulated facial images using image preprocessing, feature extraction, and classification techniques.
- Currently enhancing the model using larger datasets and improved detection approaches to strengthen accuracy and robustness against modern synthesis methods.

2: Microplastics Detection System (SIH College-Level Selection)

- Contributed to an integrated hardware-software solution engineered for microplastics detection and real-time environment sampling.
- Architected system design structures, established reliable data processing workflows, and coordinated software-to-hardware data integration pipelines.
- Achieved official college-level selection status representing the institution for the Smart India Hackathon (SIH).

3: Smart Household Management System

- Designed a comprehensive, simulation-based smart home solution integrating automated waste segregation, item identification, and micro-management mechanics.
- Implemented distinct technical safeguards for phantom load monitoring and automated leak prevention to structurally improve overall household sustainability and energy efficiency metrics.

IN PROGRESS

1: AI-Powered Business Assistant Platform

- Developing an enterprise-grade, AI-driven business automation platform structured for continuous customer interaction management and scalable lead handling workflows.
- Building dynamic response generation engines, rule-based workflow automation triggers, and comprehensive analytical dashboards for monitoring operational health.
- Focused strictly on increasing organic customer engagement metrics while simultaneously optimizing and minimizing manual operational overhead.
